

Values from three simulations from SimThyr evaluated with ggmulti - High-Dimensional Visualizations.

Patterns and explanations.

**SimThyr** is a simulation program for the pituitary thyroid feedback control that is based on a parametrically isomorphic model of the overall system that aims in a better insight into the dynamics of thyrotropic feedback. Applications of this program cover research, including development of hypotheses, and education of students in biology and medicine, nurses and patients.

<https://sourceforge.net/p/simthyr/home/SimThyr/>

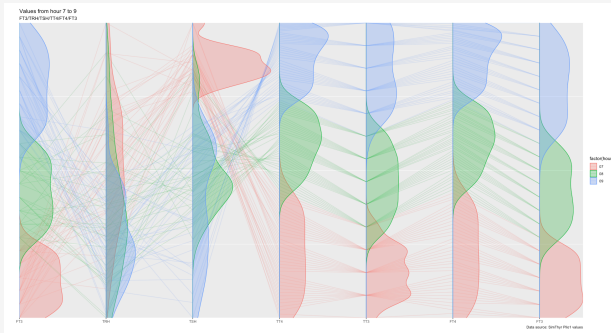

You may find different scenarios build for SimThyr here: <https://sourceforge.net/projects/simthyr/files/Scenarios/> The two files presented below are taken from these scenarios.

Below you find plots for three hours and later data for a day.

Kubota 2 (Case No. 2 from Kubota et al. showing overt hypothyroidism)

Pilo 1 (Case No. 1 from Pilo et al. showing slight hyperdeiodination and high conversion rate)

Standard

Looking at the density profiles for each of the hours 7 to 9 shows that there is only one value for TT3 and FT3 for the time 7 to 8 - which causes the algorithm to exclude the number. Apart from this we also see changes in the profiles for TSH compared to both Pilo 1 and the Standard figures.

TSH:  
 Min. 1st Qu. Median Mean 3rd Qu. Max.  
 37.64 54.56 70.43 69.41 81.98 124.07

TSH:  
 Min. 1st Qu. Median Mean 3rd Qu. Max.  
 0.000 1.013 1.360 1.329 1.621 2.299

TSH:  
 Min. 1st Qu. Median Mean 3rd Qu. Max.  
 1.048 1.568 2.074 2.030 2.454 3.451

FT3:  
 Min. 1st Qu. Median Mean 3rd Qu. Max.  
 3.121 3.121 3.122 3.122 3.124 3.124

FT3:  
 Min. 1st Qu. Median Mean 3rd Qu. Max.  
 6.942 6.945 6.962 6.962 6.980 6.983

FT3:  
 Min. 1st Qu. Median Mean 3rd Qu. Max.  
 5.601 5.601 5.604 5.604 5.607 5.607

FT4:  
 Min. 1st Qu. Median Mean 3rd Qu. Max.  
 6.441 6.442 6.445 6.445 6.447 6.448

FT4:  
 Min. 1st Qu. Median Mean 3rd Qu. Max.  
 13.63 13.67 13.71 13.71 13.74 13.79

FT4:  
 Min. 1st Qu. Median Mean 3rd Qu. Max.  
 18.47 18.49 18.52 18.53 18.57 18.59

Proposed reference intervals from SPINA-THYR

Units for the different parameters.

## What does the algorithm do?

Parallel coordinates use parallel axes instead of perpendicular to represent dimensions of a multidimensional data set [25], [26]. A vertical line is used for the projection of each dimension or attribute, with the maximum and minimum values of each dimension usually scaled to the upper and lower boundaries on those vertical lines. A polyline made up of  $n-1$  lines at the appropriate dimensional values connects the axes to represent an  $n$ -dimensional point. Georges Grinstein, Marjan Trutschl, Urška Cvek

See also this reference: <http://www.agocg.ac.uk/reports/visual/casestud/brunsdon/parallel.htm>

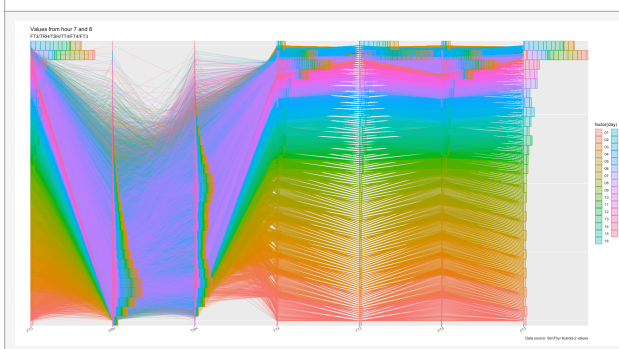

It is obvious that with disease the patterns changes, with the values for T3 and T4 are compressed or turned. The patterns for T3 are changed, less obvious are the changes in TRH and TSH.

Significance - add to the obvious from these images that FT3/TT3 has a very narrow index compared to TSH. FT3 and TT3 are very stable within the different time periods compared to TSH and TRH.

Novelty - for me it is new how narrow the index for FT3 and TT3 are (In the model). Another pattern from some of the images points out that some advanced mathematics is needed for explaining the torsion seen. See Inselberg below.

This points at a careful judgement of the free T3 values as the changes may occur in the third or fourth place after the comma.

An animated version of the data you may find here: <https://www.glensbo.dk/Simthyr/> ( Google Chrome ok but Firefox/Safari may cause trouble?)

Inselbergs work: <http://www.ifs.tuwien.ac.at/~mlanzenberger/teaching/ps/ws04/stuff/auth/00146402.pdf>
